Lyris Dsilva

Binghamton, NY

+1 607-296-8910 dsilvalyris@gmail.com linkedin.com/in/lyrisdsilva github.com/lyrisdsilva

Skills

SQL & Data Modeling: Complex queries, CTEs, window functions, joins, query optimization, data modeling, schema design, ETL/ELT, data warehousing
Data Analysis: Exploratory data analysis, data cleaning and validation, customer segmentation, cohort and churn analysis, A/B testing, statistical analysis, root cause analysis
Python & Machine Learning: pandas, NumPy, matplotlib, scikit-learn, Jupyter, regression, classification, predictive modeling
Business Intelligence: Tableau, Power BI, Looker, dashboards, KPI reporting, data visualization, data storytelling
Databases: PostgreSQL, MySQL, SQL Server (T-SQL), Snowflake, DuckDB, MongoDB
Tools & Practices: Excel (pivot tables, lookups), Google Sheets, Git, Jira, Confluence, REST APIs, JSON, Agile/Scrum, stakeholder communication

Education

Binghamton University – *Master of Science, Computer Science* *Aug 2025 – Present*

St Francis Institute of Technology – *Bachelor of Engineering, Computer Engineering* *Aug 2022 – May 2025*

Experience

IpserLab Fort Worth, TX (Remote)
Software Developer Intern (Data & Analytics) *Jul 2026 – Present*

- Deliver accurate, reproducible recurring and ad hoc reports by writing complex multi-table PostgreSQL queries and speeding up slow ones with indexing and restructured joins
- Validate data accuracy, completeness, and integrity before release, catching data quality issues before they reached users and tracing anomalies to their root cause
- Build Java (JDBC) ETL pipelines and design data models and schemas that keep data consistent across multiple tables and production features
- Translate business requirements into data solutions in Agile sprints, presenting findings and recommendations that non-technical stakeholders acted on

Prodigy InfoTech Mumbai, IN
Full-Stack Web Developer Intern *Jun 2024 – Jul 2024*

- Cut API response times by 40% by investigating a performance decline, analyzing where time was spent, and fixing the bottlenecks behind it

Projects

Telco Customer Churn Analysis | *SQL, Python (pandas, scikit-learn), Jupyter*

- Analyzed 7,043 customer records with SQL (CTEs, window functions, conditional aggregation) and Python (pandas) to find why customers leave; identified a segment of first-year, month-to-month fiber customers who were 13% of customers but 34% of all churn ($53K in lost monthly revenue)
- Built logistic regression and gradient boosting churn models (AUC 0.85, 5-fold cross-validation) showing month-to-month contracts carry 3.5× and fiber service 2.4× the churn odds; the riskiest 20% of customers contained half of all churners
- Turned findings into 5 testable retention recommendations, with a revenue-sizing scenario estimating a 3–6× return on a targeted retention offer

E-Commerce Sales & Customer Analysis | *SQL (PostgreSQL), Python (pandas), Tableau*

- Analyzed 100K+ orders from the public Olist dataset with SQL (multi-table joins, window functions) and Python (pandas) to identify what drives sales, repeat purchases, and delivery delays
- Built a Tableau dashboard of sales KPIs comparing customer review scores for late versus on-time deliveries, and used the results to recommend operational fixes for delivery delays

E-Health Care Platform | *Python, Django, SQL, Machine Learning*

- Built machine learning models on a SQL patient-record data model to automate early screening for heart disease, diabetes, and pneumonia, and served predictions through a Python/Django app
